#### Abstract

Montmorillonite K-10 mediated green and one-pot synthesis of 2 -substituted quinolines has been accomplished via a 3-component reaction of aniline, aldehydes and ethyl 3,3diethoxypropionate in the presence of air oxygen in water. The crystal structure analysis and H-bonding patterns of one compound prepared are presented.

Development of efficient and environmentally friendly synthetic methodologies for the commonly used small organic molecules is one of the major challenges in modern organic synthesis. Quinolines, because of their numerous pharmacological properties, are often considered as widely used $N$-heterocycles in both academia and the pharmaceutical industry. ${ }^{1,2}$ It is not surprising that a number of methods have been developed for the construction of a quinoline ring, including Skraup, DoebnerMiller, Doebner, Combes or Pfitzinger syntheses. ${ }^{2}$ Though very effective, many of these methods, however, often involve the use of various acids or reagents that are not environmentally compatible, produce a large amount of waste and require longer reaction times. The multicomponent domino reactions are known to afford structurally complex and diversity based molecules in a single step operation that ensures high atom economy as well as good overall yields. ${ }^{3}$ We envisioned that a similar strategy for the construction of a functionalized quinoline ring would not only be beneficial for the development of a simpler and straightforward method ${ }^{4}$ but also might increase the chances of achieving a greener synthetic route. In continuation of our interest in quinoline derivatives ${ }^{5}$ of potential pharmacological interest, we now wish to report a one-pot synthesis of 2 -substituted quino-line-3-carboxylate esters ${ }^{6}$ via a 3-component reaction of

[^0]aniline (1), aldehydes (2) and ethyl 3,3-diethoxypropionate (3) in the presence of montmorillonite $\mathrm{K}-10$ as a green and reusable catalyst and air oxygen in water (Scheme 1). In view of the known antimicrobial activities of quinolines ${ }^{1}$ we expected that the present class of compounds would show relevant pharmacological properties.

In our initial study, the reaction of aniline 1a, 3,4-difluoro benzaldehyde (2a) and ester $\mathbf{3}$ was carried out in water in the presence of $p$-toluenesulfonic acid ( $p$-TSA) and air at $90{ }^{\circ} \mathrm{C}$ when the corresponding quinoline $4 \mathbf{a}$ was isolated in $41 \%$ yield (entry 1, Table 1). The use of other Lewis acids such as

Scheme 1 Green synthesis of quinolines via an MCR.

Table 1 Effect of reaction conditions on the MCR of $\mathbf{1 , 2 a}$ and $\mathbf{3}^{a}$

| Entry | Catalyst | Solvent | \% yield ${ }^{\text {b,c }}$ |
| :--- | :--- | :--- | :--- |
| 1 | $p-\operatorname{TSA}(2.5 \mathrm{~mol} \%)$ | $\mathrm{H}_{2} \mathrm{O}$ | 41 |
| 2 | $\mathrm{ZnCl}_{2}(2.5 \mathrm{~mol} \%)$ | $\mathrm{H}_{2} \mathrm{O}$ | 15 |
| 3 | $\mathrm{TiCl}_{4}(2.5 \mathrm{~mol} \%)$ | $\mathrm{H}_{2} \mathrm{O}$ | 30 |
| 4 | $\mathrm{SnCl}_{4}(2.5 \mathrm{~mol} \%)$ | $\mathrm{H}_{2} \mathrm{O}$ | 10 |
| 5 | Montmorillonite K-10 $(50 \% \mathrm{w} / \mathrm{w})^{\mathrm{H}_{2} \mathrm{O}}$ | $83(80)^{d}$ |  |
| 6 | Montmorillonite K-10 $(20 \% \mathrm{w} / \mathrm{w})$ | $\mathrm{H}_{2} \mathrm{O}$ | 41 |
| 7 | Montmorillonite K-10 $(0.5 \% \mathrm{w} / \mathrm{w})$ | $\mathrm{H}_{2} \mathrm{O}$ | 28 |
| 8 | No catalyst | $\mathrm{H}_{2} \mathrm{O}$ | 0 |
| 9 | Montmorillonite K-10 $(50 \% \mathrm{w} / \mathrm{w})$ | EtOH | 35 |

${ }^{a}$ All the reactions were carried out using $\mathbf{1}(0.98 \mathrm{mmol})$, 2a $(1.07 \mathrm{mmol})$ and $3(2.45 \mathrm{mmol})$ in a solvent at $90^{\circ} \mathrm{C}$ for 5 h in the presence of air. ${ }^{b}$ With respect to the aniline $\mathbf{1}$ used. ${ }^{c}$ Isolated yield. ${ }^{d}$ Recovered montmorillonite K-10 was used.

${ }^{a}$ All the reactions were carried out using aniline $\mathbf{1}(0.98 \mathrm{mmol})$, aldehyde 2 ( 1.07 mmol ), ethyl 3,3-diethoxypropionate $\mathbf{3}(2.45 \mathrm{mmol})$ and montmorillonite K-10 ( 75 mg ) in water at $90^{\circ} \mathrm{C}$ in the presence of air. ${ }^{b}$ Isolated yields.

Scheme 2 Synthesis of quinolines $\mathbf{6 a}, \mathbf{b}$.
$\mathrm{ZnCl}_{2}, \mathrm{TiCl}_{4}$ and $\mathrm{SnCl}_{4}$ was examined but was found to be less effective as the expected product $\mathbf{4 a}$ was isolated in $10-30 \%$ yield (entries $2-4$, Table 1). We then examined the use of montmorillonite K-10 (entry 5, Table 1). To our satisfaction, the reaction proceeded well affording the desired product in $83 \%$ yield within 5 h . To test the recyclability of the catalyst, montmorillonite K-10 was recovered by simple filtration and reused when $4 \mathbf{a}$ was isolated without significant loss of yield. The yield of 4 a was found to be 80,77 and 75 after 1st, 2nd and 3rd recovery and reuse of the catalyst. The use of a lower quantity of montmorillonite K-10 decreased the product yield (entries 6 and 7, Table 1) whereas the reaction did not proceed in the absence of catalyst indicating the key role played by the catalyst (entry 8 , Table 1). While water was used as a solvent in all these cases, other solvents such as EtOH (entry 9, Table 1), DMSO, DMF, acetonitrile, and toluene however were found to be less effective in the present MCR. Thus, a combination of montmorillonite $\mathrm{K}-10$ in water was found to be optimal for the preparation of $\mathbf{4 a}$.

To test the generality and scope of this green MCR, a range of aldehydes (2) were employed under the optimized reaction conditions $^{7 a}$ (Table 2). Various electron donating, e.g. F, Cl, Br, Me and OMe (entries $1-7$, Table 2), or electron withdrawing groups, e.g. $\mathrm{NO}_{2}$ and $\mathrm{CF}_{3}$ (entries 8 and 10, Table 2), present on the aryl ring of aldehydes were well tolerated. The reaction proceeded well irrespective of the substituents present in the aldehydes employed (entries 9 vs. $1-7,8$ and 10, Table 2). The use of heteroaromatic and aliphatic aldehydes was also successful and afforded the desired quinolines in good yields (entries 11-13, Table 2). We then examined the use of other anilines in place of 1. Thus, benzo $[d][1,3]$ dioxol-5-amine (5) reacted with $\mathbf{3}$ and

Fig. 1 ORTEP representation of compound $\mathbf{4 j}$ (thermal ellipsoids are drawn at $50 \%$ probability level).

Fig. 2 The hydrogen bonding pattern in molecule $\mathbf{4 j}$.
aldehyde $\mathbf{2 a}$ or $\mathbf{2 h}$ smoothly to give the desired product $\mathbf{6 a}$ or $\mathbf{6 b}$ in good yield (Scheme 2). The use of 1,1-diethoxyethane in place of $\mathbf{3}$ was also examined via the reaction of $\mathbf{1}$ along with $\mathbf{2 i}$ when the desired product ${ }^{7 b}$ was isolated in $70 \%$ yield. While all the new compounds synthesized were well characterized by spectral (NMR, IR and MS) data, the molecular structure of a representative compound $\mathbf{4} \mathbf{j}$ was established unambiguously by single crystal X-ray diffraction (Fig. 1). ${ }^{8}$ The compound $\mathbf{4 j}$ crystallizes in the monoclinic $P 2_{1} / c$ space group with one molecule in the asymmetric unit $\left(Z=4, Z^{\prime}=1\right)$ (Fig. 2). While the molecule in the asymmetric unit as such had no conventional functional groups to form H -bonding, the ethyl ester and trifluoro groups present however were responsible for the formation of weak intermolecular H-bonding. The inversion related molecule in the asymmetric unit forming the dimer synthon through $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions is shown in Fig. 2. They formed channels with one molecule above and one molecule below via $\mathrm{C}-\mathrm{H} \cdots \mathrm{F}$ interactions and are stabilised by aromatic $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions. These interactions propagated in 3D network packing along the $a c$ plane as shown in Fig. 3.

Mechanistically, the reaction seems to proceed (Scheme 3) via in situ generation of (i) an imine from the aniline (1) and aldehyde (2) and (ii) a 3-hydroxy acrylate from ethyl 3,3diethoxypropanoate (3) under the mild acidic conditions employed. The Mannich reaction between the imine and 3hydroxy acrylate derivative followed by intramolecular cyclization afforded the 1,2-dihydroquinoline intermediate, which on subsequent oxidation in the presence of air oxygen provided the

Fig. 3 The molecular arrangement along the ac plane in molecule $\mathbf{4 j}$.

Scheme 3 Proposed reaction mechanism.

Scheme 4 Structure elaboration of quinoline $\mathbf{4 a}$.
desired product. ${ }^{9}$ The role of air oxygen was further confirmed by the isolation of ethyl 2-(3,4-difluorophenyl)-6,7-dimethoxy-1,2-dihydroquinoline-3-carboxylate when the MCR of 1, 2a and $\mathbf{3}$ was carried out strictly under inert atmosphere maintaining the other conditions as presented in entry 5 of Table 1.

To demonstrate the further scope of this MCR, structure elaboration of quinoline $\mathbf{4 a}$ was carried out via the reaction with morpholine (7) in the presence of 1,2,4-triazole to give the corresponding amide 8 (Scheme 4). Some of the quinolines (4) synthesized were tested for their inhibitory properties against Mycobacterium tuberculosis H37Rv chorismate mutase (CM) in vitro. ${ }^{10}$ Compounds $\mathbf{4 a}$ and $\mathbf{4 b}$ showed $30 \%$ inhibition of CM when tested at $50 \mu \mathrm{M}$.

In conclusion, a direct and one-pot synthesis of 2-substituted quinolines of potential medicinal interest has been accomplished via a 3-component reaction in water in the presence of air oxygen. Montmorillonite K-10 was identified as a green and reusable catalyst in this MCR. The methodology could be useful in constructing a diversity based library of small molecules related to the quinoline framework.
